

**Together, we can** obtain maximum performance and quality assurance.

Spiral wound elements are ideal for most concentration or clarification applications. They are energy efficient, compact, economical to install, and allow maximum operating flexibility for many filtration and separation processes. Their rugged construction suits a broad range of chemical, temperature and pressure applications.

We have the capability to engineer and produce systems ranging in size from a pilot plant, to large qualified and experienced design engineers work with customers to analyse the application and recommend the optimum configuration. Where a standard configuration is not the optimum solution, a customised system can be offered.

## **Working Together**
